Duration of anti-fall devices

For products with a predominance of textile tape

The lifespan depends not only on environmental factors **1** and particular cases of use **2**, but also on the intensity and frequency of use to which the device is subjected.

Exceptional circumstances could limit life span.

Given the delicacy of some components such as sewn tapes, energy absorbers, cords, we suggest checking them more intensely.

For products with a predominance of metal

We do not give a life span, as the latter can be unlimited to the extent that the product is subject to regular maintenance (at least annually).

For products not subject to maintenance (not openable), the life span is at most 10 years **1** and **2**.

Note

1 Environmental factors: contact with chemicals, inappropriate storage, exposure to high heat sources > 50 ° C, UV, abrasion ...

2 Special use cases: product deterioration, fall arrest, mechanical deformation, product fall, premature wear, intensity of use and incorrect conditions of use.

In any case, the products must always be subjected to an annual audit.

Positioning belt

Positioning belt (**Titan model**) in polyamide, fully adjustable and adaptable to all sizes, light with 2 side D-rings in stainless steel for positioning lanyard.

Compliant with standard **EN 358**.

The belt alone does not constitute a fall arrest device.
